ENGINEERING WEATHER DATA

This manual gives uniform engineering weather data for winter heating design, heating degree days, summer air conditioning design and criteria, for calculating energy consumption estimates, and cooling degree days.

South America 6-7

The data in this manual were compiled by the Engineering Meteorology Section (ENE) of the USAF Environmental Technical Applications Center (USAFETAC), at the request of the Department of Defense (DOD). Air Force Directorate of Civil Engineering, U.S. Army Corps of Engineers and the Naval Facilities Engineering Command assisted in identifying the sites of interest to the Air Force, Army, and Navy respectively. The majority of sites listed are located at military installations. Data for locations other than those specifically listed in Chapters 1 through 4 may be obtained by written request, giving the coordinates and elevation of the desired site, to USAFETAC/ENE, Scott AFB IL 62225. USAFETAC, however, has the authority to provide such data only to DOD or its subordinate organizations and civilian contractors with military contracts. Requests for data for sites of nonmilitary governmental interest should be forwarded for processing to the National Climatic Center, Federal Building, Asheville NC 28801. Requests for data for sites of a nongovernmental interest should be obtained from a private consulting meteorologist. A list of their names and addresses may be obtained from the American Meteorological Society, 45 Beacon Street, Boston MA 02108.

Location. Stations are listed alphabetically–Chapter 1, 3, and 5 by state; Chapters 2, 4, and 6 by area and country. The latitude, longitude, and elevation for each station or site are given. In listing the stations in Chapter 3, it was attempted to list stations representative of the various climatic regimes experienced throughout the United States. In Chapter 4 an attempt was made to select stations representative of the various climatic regimes of major military interest outside the United States.

CHAPTER 1–WINTER DESIGN DATA FOR HEATING, AND SUMMER DESIGN AND CRITERIA DATA FOR AIR CONDITIONING FOR SITES IN THE UNITED STATES; AND CHAPTER 2–FOR SITES OUTSIDE THE UNITED STATES

Winter Design Data–Heating. These data are the dry bulb temperatures (°F) that are equalled or exceeded 99% and 97½% of the time, on the average, during the coldest 3 consecutive months. For the contiguous United States, these months have been standardized as December, January, and February, even through at a few sites, March was colder than December. The prevailing (Pvlg) wind direction is the wind direction occurring most frequently with the 97½% dry bulb winter design temperature. The mean wind speed (knots) is the average of those wind speed values which occur coincidently with the 97½% dry bulb winter design temperature.

Degree Days–Heating. Heating degree days are the mean annual number of degree days using a base of 65°F and a 30-year normal period of record when available.

Summer Design Data–Air Conditioning. These data are the dry bulb and wet bulb temperatures (°F) that are equalled or exceeded 1%, 2½% and 5% of the time, on the average, during the warmest 4 consecutive months, as determined from the monthly mean wet bulb temperature. For the contiguous United States, these months have been standardized as June, July, August, and September, even though at a few sites October was warmer than June. The mean coincident wet bulb temperatures (MCWB) listed with the 1%, 2½%, and 5% dry bulb summer design temperatures are the average of those wet bulb temperatures which occur coincidently with the respective dry bulb summer design temperatures. The mean daily range (difference between daily maximum and daily minimum temperature) is the average of all daily dry bulb temperature ranges for days on which the 2½% dry bulb summer design temperature is reached or exceeded. The prevailing (Pvlg) wind direction is the wind direction occurring most frequently with the 2½% dry bulb summer design temperature.

Summer Criteria Data–Air Conditioning. These data are the number of hours, on the average, that the dry bulb temperatures of 93°F and 80°F and the wet bulb temperatures of 73°F and 67°F are equalled or exceeded during the warmest 6 consecutive months as determined from the monthly mean wet bulb temperature. For the contiguous United States, these months have been standardized as May through October, even though at a few sites November was warmer than May.

CHAPTER 3–DATA FOR USE IN CALCULATING ENERGY CONSUMPTION ESTIMATES FOR SITES IN THE UNITED STATES; AND CHAPTER 4–FOR SITES OUTSIDE THE UNITED STATES

Any station listed in Chapter 3 or 4 had to have recorded 24 hourly observations per day for a period of at least 5 years. Due to rounding, the observation counts in the columns are not necessarily an exact count of the hours in an 8-hour period or for the month.

Dry Bulb Temperature Data. Temperature distributions are listed by 5 degree temperature intervals, by month, and annual. The distribution is further divided into 3 periods of the day, which define the major activity use of the installation; sleep (01–08 hrs), work (09–16 hrs), and recreation (17–00 hrs). Total observation columns list the distribution of temperature based on 24 hours per day.

Mean Coincident Wet Bulb Temperature Data. The mean coincident wet bulb

(MCWB) temperature value is the mean value of all those wet bulb temperatures which occur coincidently with the dry bulb temperatures in the particular 5 degree temperature interval. At the upper or warmer end of the mean coincident wet bulb distribution, the values occasionally reverse their trend because the highest wet bulb temperatures do not necessarily occur with the highest dry bulb temperatures.

CHAPTER 5–COOLING DEGREE DAY DATA FOR SITES IN THE UNITED STATES; AND CHAPTER 6–FOR SITES OUTSIDE THE UNITED STATES

Degree Day–Cooling. Cooling degree days are the mean annual number of cooling degree days using a base of 65°F and a 30-year normal period of record when available. Cooling degree days are the departure of the mean daily temperature above 65°F.

ABBREVIATIONS

The following abbreviations, acronyms, and contractions are those used more than once in the station listing for chapters 1 through 6:

AAF	Army Airfield
AAFB	Auxiliary Air Force Base

BERNARD W. ROGERS
General, United States Army
Chief of Staff

J. C. PENNINGTON
Brigadier General, United States Army
The Adjutant General

D. G. ISELIN
Rear Admiral, CEC, U. S. Navy
Commander, Naval Facilities
Engineering Command

SUMMARY OF CHANGES

The statistics in this revision are based on a 15-year period of record of hourly surface observations when available. Statistics included for the first time in this manual are as follows: Prevailing wind direction and mean wind speed coincident with the 97½% temperature, annual heating degree days, mean daily range of the dry bulb temperature and the prevailing wind direction coincident with the 2½% dry bulb temperature, and annual cooling degree days. In chapters 3 and 4 the three time periods have been started 1-hour earlier in order to better define time periods in which various facilities are used. A list of abbreviations used has been included. Coordinates and elevations for all sites are listed. The 10% values of summer dry and wet bulb temperatures have been deleted.

Distribution:

Air Force: F

Army: To be distributed in accordance with DA Form 12-34B, requirements for TM 5-800 series: Engineering and Design for Real Property Facilities.

Navy: (2 copies each unless otherwise specified)
